## Y7 Mastery: Unit 8 - Classifying 2D shapes

## Rotational Symmetry

Draw around the shape on tracing paper. Do not start counting when the shape is in the original position

The equilateral triangle has a rational symmetry of order 3. This is because
it fits on itself 3 times in one complete rotation.

| Keyword/Skill | Definition/Tips |
| :--- | :--- |
| Rotational <br> Symmetry | Looks at how many times an <br> image looks exactly the same <br> in a complete turn. |
| Order | The number of times an <br> object fits over its own image <br> in one complete turn |
| Reflective <br> symmetry | The reflected shape will be <br> exactly the same as the <br> original, the same distance <br> from the mirror line and the <br> same size. |
| Line of <br> symmetry | The line that cuts a shape in <br> half exactly. |
| Scalene <br> triangle | Triangle where the three sides <br> are different lengths and the <br> angles are all different sizes. |
| Equilateral <br> triangle | Triangle where all three sides <br> are equal length and all <br> angles are equal. |
| Isosceles <br> triangle | Triangle with two sides of <br> equal length and two equal <br> angles. |
| Right-angle <br> triangle | Triangle where one of its <br> angles is a right-angle. |
| Angle | A measure of turn with the |

Angles in a triangle sum to 180

Make sure that you find all the lines of symmetry to answer a question.

- Lines of symmetry can be vertical, horizontal or diagonal
- The line of symmetry is also called the mirror line or the axis of symmetry.
- A circle has infinite lines of symmetry.
- The lines of symmetry on a shape intersect (cross) at a point.
his heptagon has
1 line of symmetry

A rectangle has 2 lines of symmetry.

A square has 4 lines of symmetry.

## Properties of Triangles

| Scalene | Isosceles | Equilateral |  |
| :---: | :---: | :---: | :---: |
| Has a <br> right <br> angle |  |  | Impossible <br> as all angles <br> are $60^{\circ}$ |
| No right <br> angle |  |  |  |

## Comparing Quadriaterals

Rectangle
Rectangle
-> 2 pairs of Parallel sides
-> 2 pairs of Parallel sides
angles
angles
-> 2 lines of symmetry
-> 2 lines of symmetry

## Parallelogram

$\rightarrow \quad 2$ pairs of equal sides $\rightarrow$ Opposite sides parallel $\rightarrow$ Opposite angles equa

| Keyword/Skill | Definition/Tips |
| :--- | :--- |
| Quadrilateral | Any 2-dimensional four sided <br> shape |
| Diagonal | Created by joining opposite <br> corner with a line (in a <br> quadrilateral) |
| Vertex | Corner |
| Parallel | Lines side by side that are <br> always the same distance <br> apart and never meet |
| Perpendicular | Meet at a right-angle <br> AdjacentNext to <br> Intersect <br> Bisect <br> lines |
| Opposite usually referring to |  |
| Reflex angle | Cut exactly in half <br> Situated on the other side <br> than $360^{\circ}$ |
| Congruent | Exactly the same size and <br> shape |
| Pair a set of two |  |

Diagonals information is in red
Order of rotational symmetry is in blue
Square

Bisect
Perpendicular
Order 4

## Rectangle

Bisect
NOT perpendicular Order 2

## Parallelogram Bisect NOT perpendicular

 Order 2

Irapezium
DO NOT Bisect
NOT perpendicular
No rotational symmetry

Kite
DO NOT Bisect
Perpendicular
No rotational symmetry

Arrowhead (Delta)
DO NOT intersect
No rotational symmetry

Angles in a Quadrilateral

$a^{\circ}+b^{\circ}+c^{\circ}+d^{\circ}=360$

## Tessellation

A shape tessellates if it fits together without any gaps. (Like tiling)

Isosceles Trapezium
